Zowe Chat Subdivision

Team Alignment

Planning
- Open Source Community
- Zowe & Bot Framework
- Code, Repo, Server, Tool, Environment preparation

Design & Development
- Architecture
- Develop & design for MVP use case

Release
- 1st stage feature release

Promotion
- Development & UX guideline
- Open community collaboration

Key Results of Design

Design Iterations

Understanding
- Take zChatOps use cases as reference
- Clarify ChatOps capability and possible use cases in general
- Pre-survey for figuring out key users and user scenarios

Design
- To-be design for key use cases
- Design mockup with sample case

Design validation
- Usability test with sponsor users
- User interviews

Release
- MVP Design delivery
- Post Feedback collection: document sponsor user activities feedback & data
- Scenario based feature vision to inspire open community contribution

Promotion
- Value proposition promotion recommendation
- Guideline to align further user experience design
- Envision the future to attract more contributors with future version design mockup

Design Alignment

- For the data that we cannot query directly, do we have any **alternative ways** to get it, e.g. Job Status Summary, Job Log key info.
- How to make Zowe Chat be **proactive**: e.g. identify users' intents and provide extra info that they might be interested in even they were just asking one question, helping us design the content of the info and priority.
- **Envision** the future and **attract** more contributions: collaborate with open community to enhance Zowe Chat together:

Design Mockup

Request Job Status by users

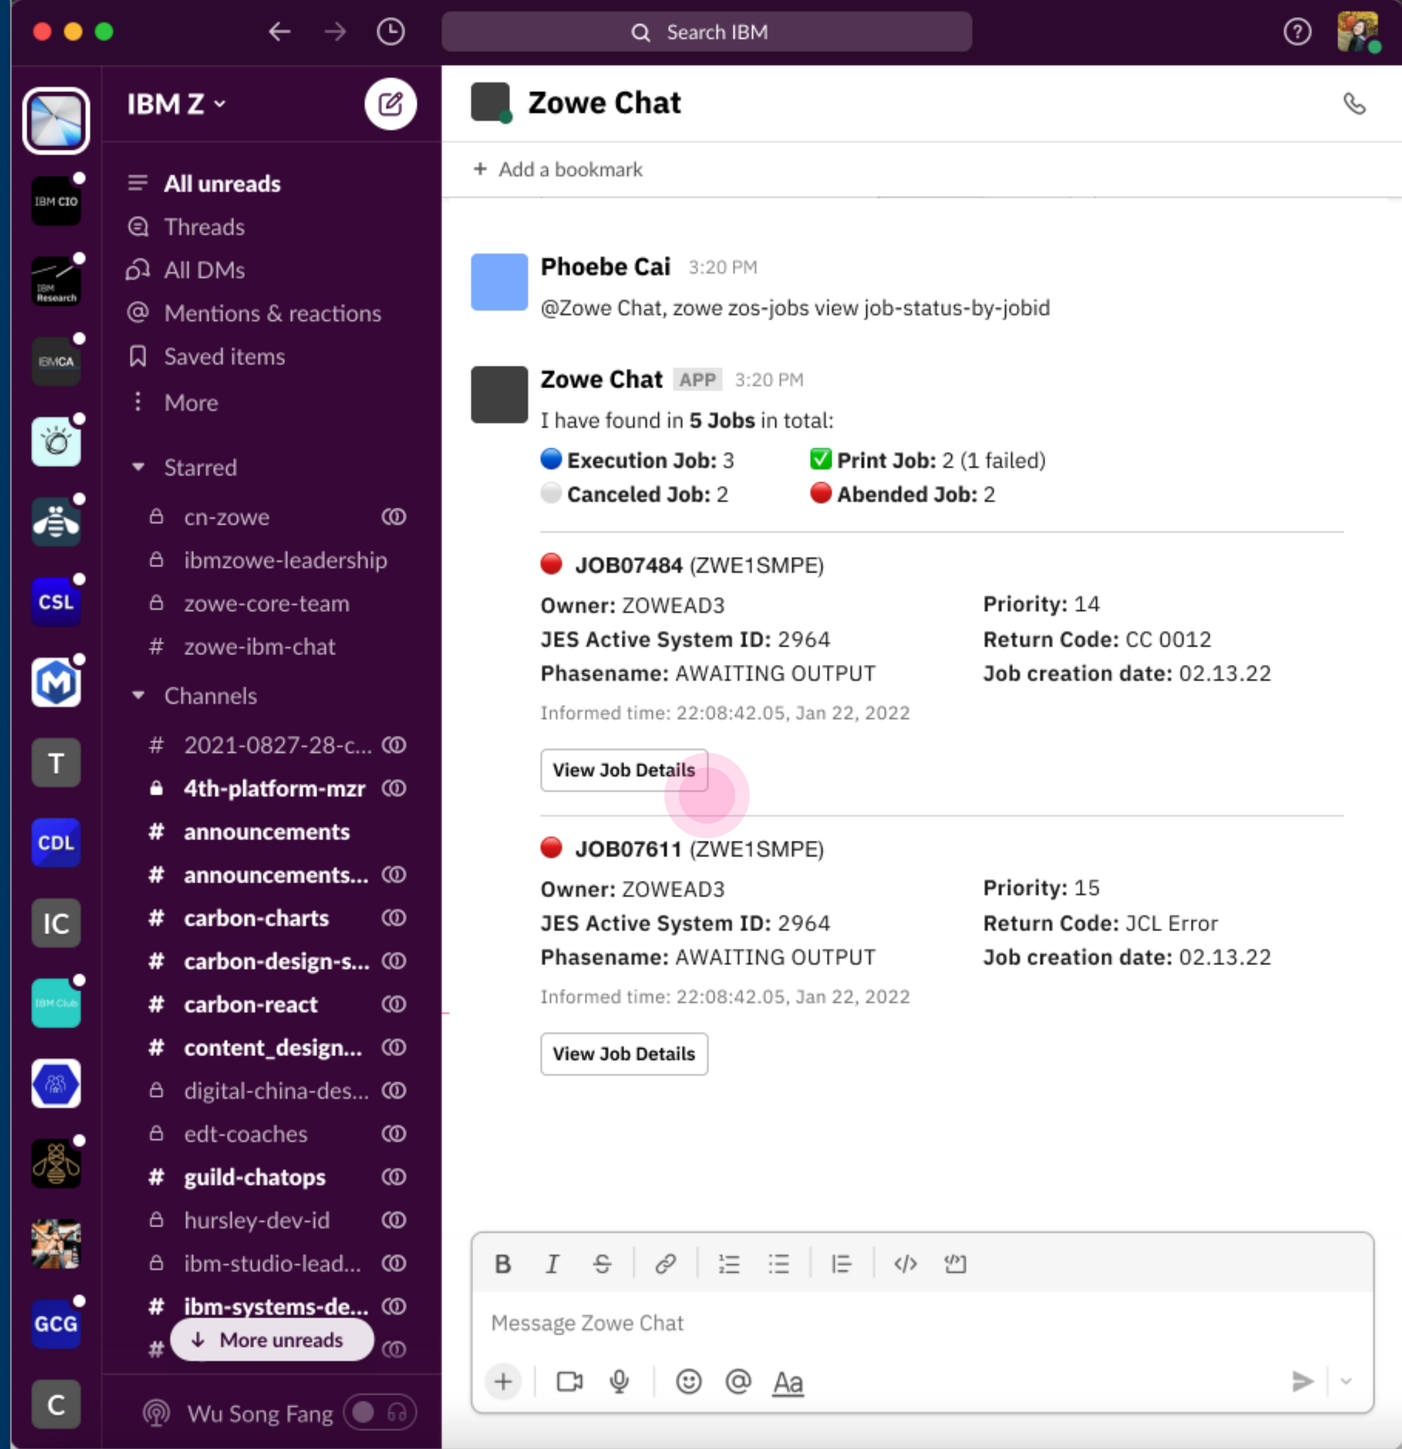
- Job Status Overview
- Show notification about the abnormal jobs
- User's Slack account was bounded to the Zowe account, so no need to login in Zowe Chat

To be discussed:

- How can we get the summary of Jobs Status?
- Can we configure specific situation to send notification, like a very urgent issue that we can expect?

For Zowe Team:

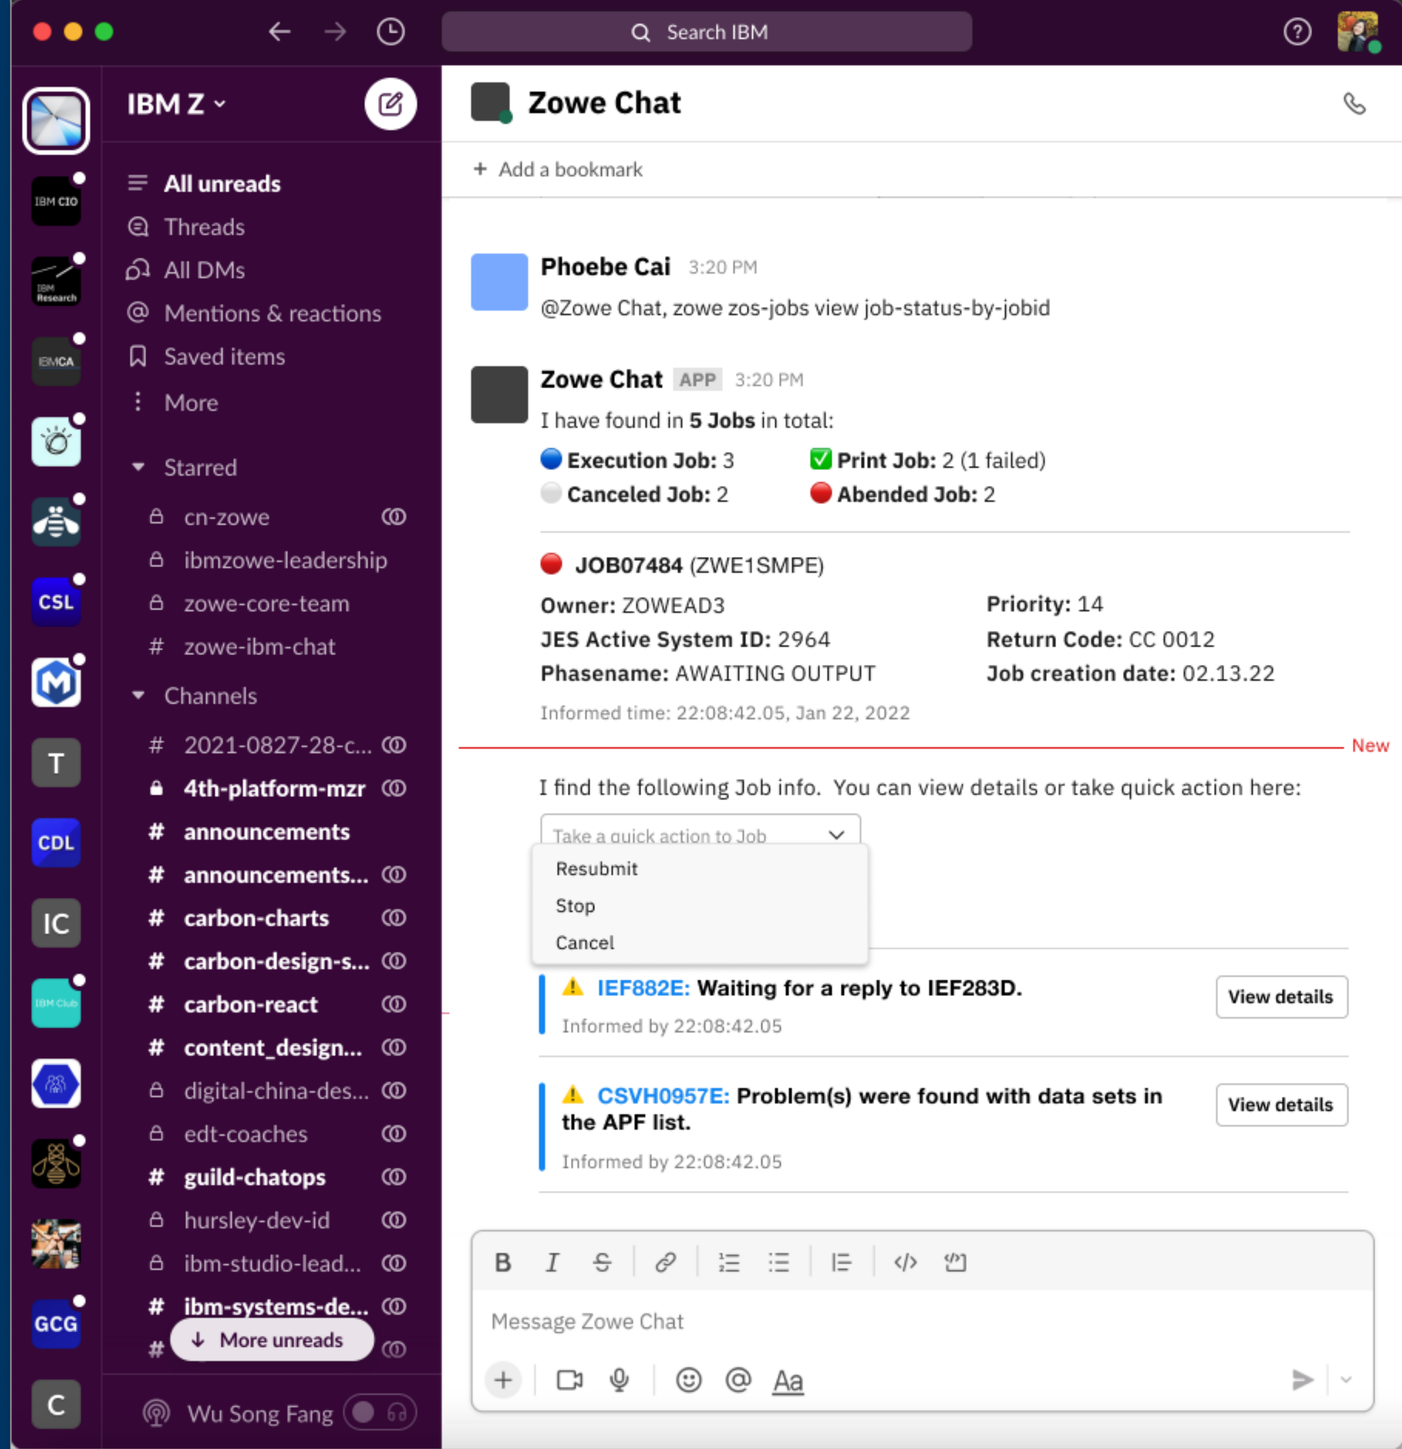
- What info will user care most to check the Job Status?
- What terms should we use for it: Alert/Notification/Incident/Issue?
- What Job Status should we pay attention to: Execution? Print? Canceled? Abended? - Active, Output, JCL error, Input.



Design Mockup

View Job Details

- Quick action selections
- Job log & System log link
- Show Error code & msg: Error code could lead to the doc site
- View details to see Error code info



To be discussed:

- What quick actions can user take in Zowe Chat: Resubmit? Stop? cancel? - Resubmit, stop.

For Zowe Team:

- Will the job with alert be stopped automatically? If not, what kind of information is helpful for the operator to take actions like “stop” ?

Design Mockup

View Job Details

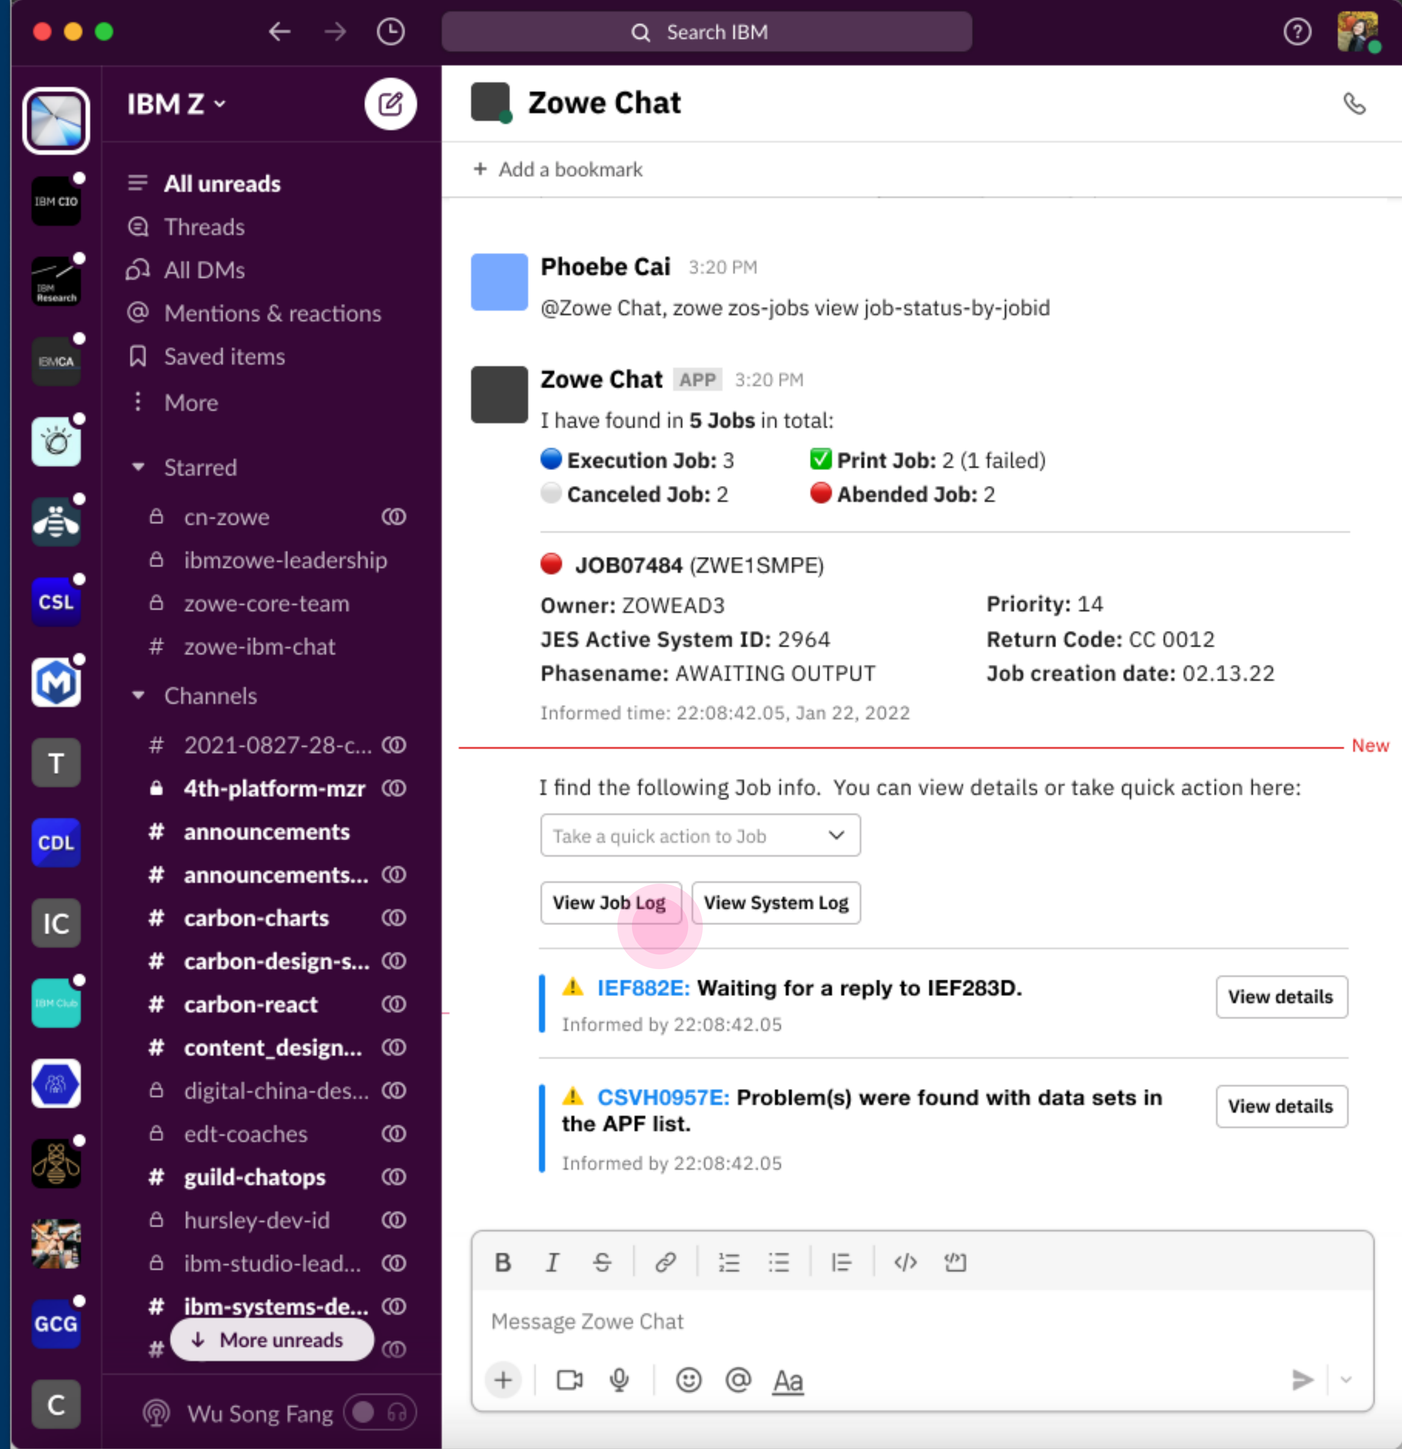
- Quick action selections
- Job log & System log link
- Show Error code & msg: Error code could lead to the doc site
- View details to see Error code info

To be discussed:

- What quick actions can user take in Zowe Chat: Resubmit? Stop? cancel?

For Zowe Team:

- Will the job with alert be stopped automatically? If not, what kind of information is helpful for the operator to take actions like “stop” ?



Design Mockup

View Job Log:

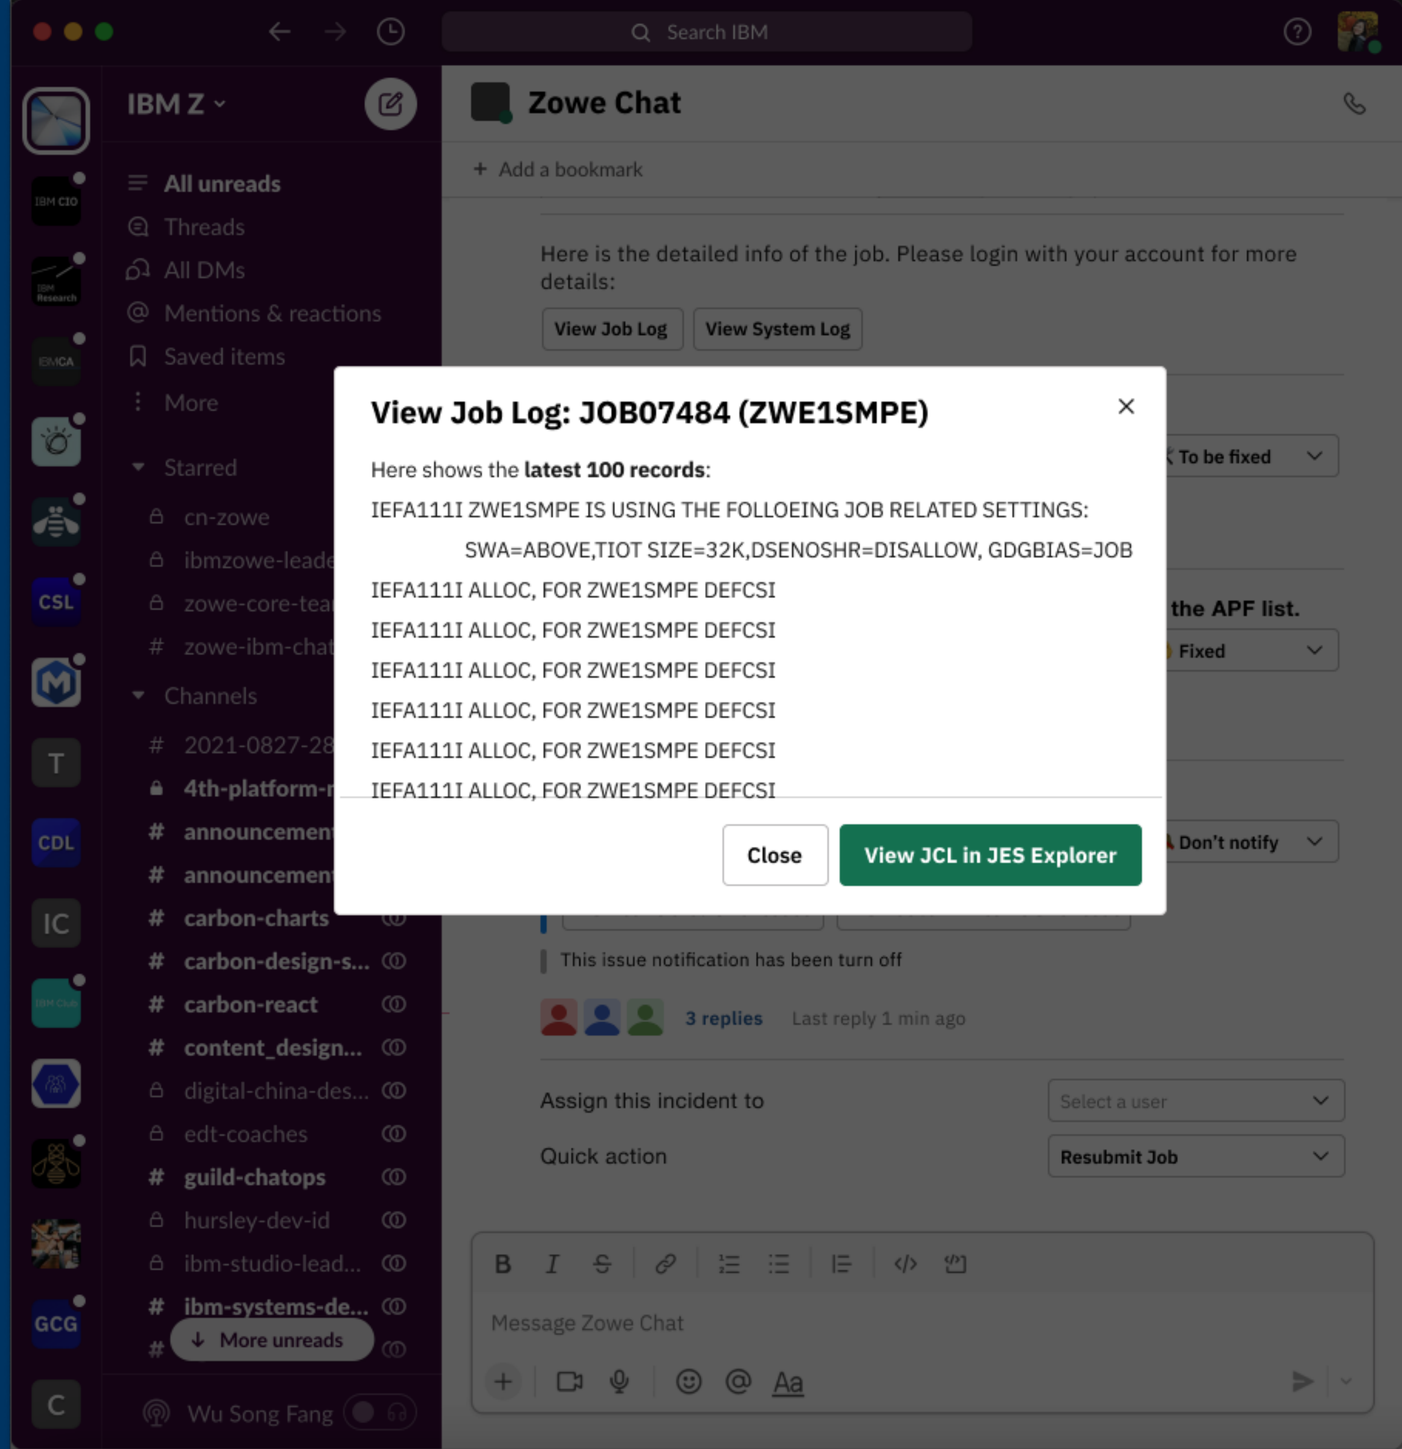
- Showing key info (TBD)
- Link to specific log

To be discussed:

- How will log be display in a pop-up?

For Zowe Team:

- Do we need to provide other options to view the JCL/Job Log? Like in 3270?



Design Mockup

View System Log:

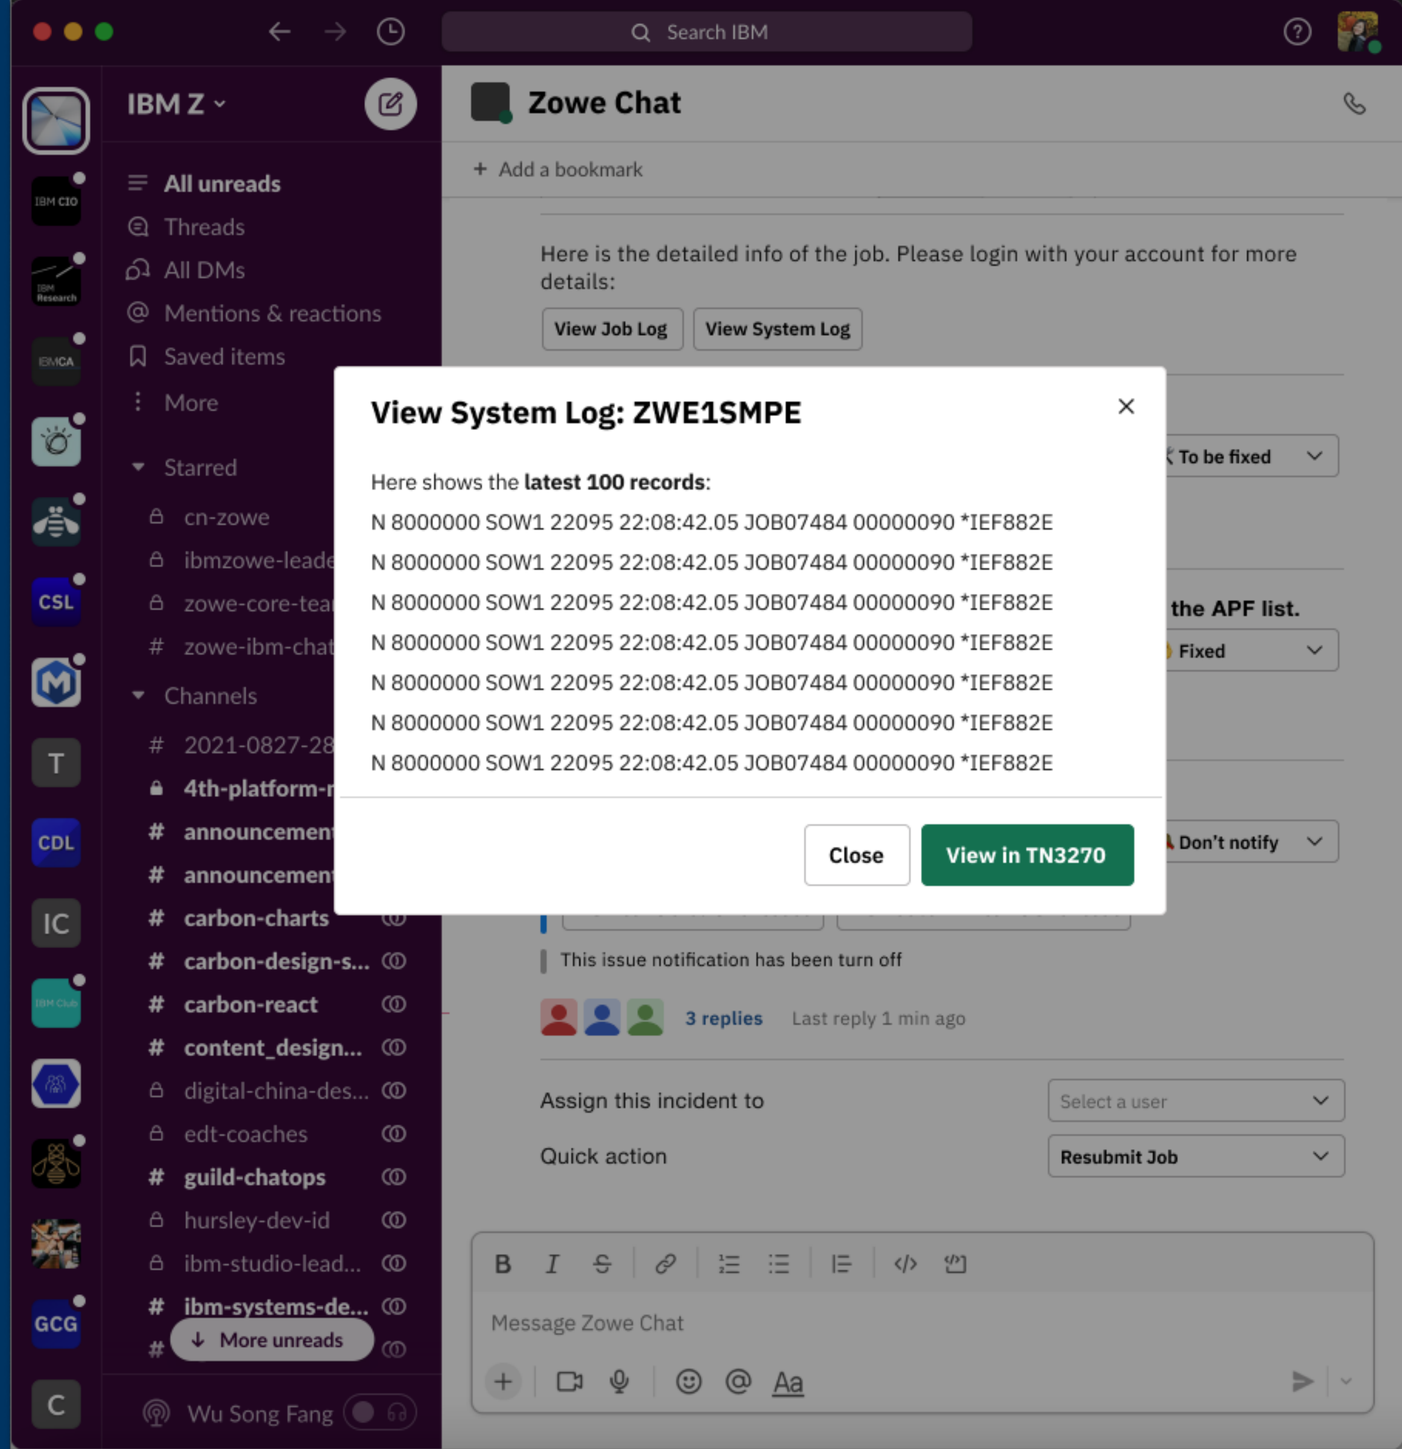
- Showing key info (TBD)
- Link to specific log

To be discussed:

- How will log be display in a pop-up?

For Zowe Team:

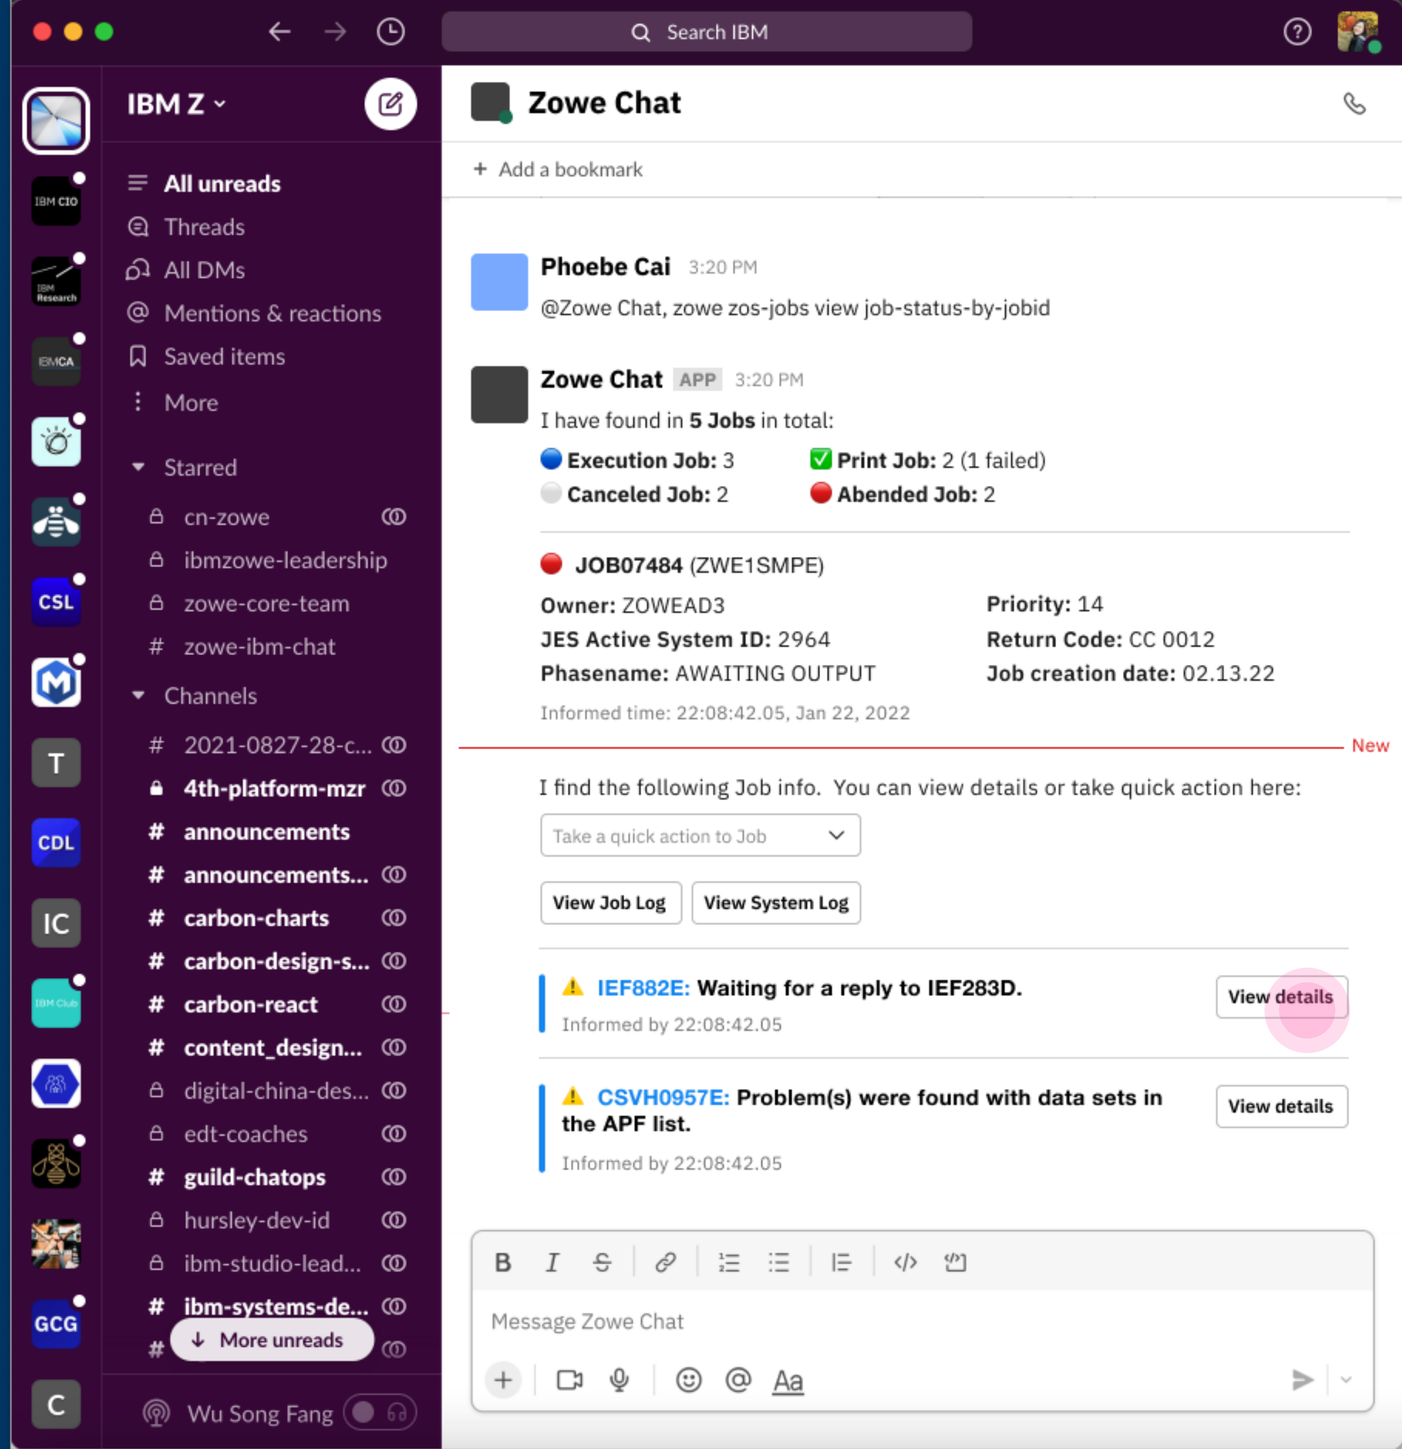
- Do we need to provide other options to view the JCL/Job Log? Like in 3270?



Design Mockup

View Error Code

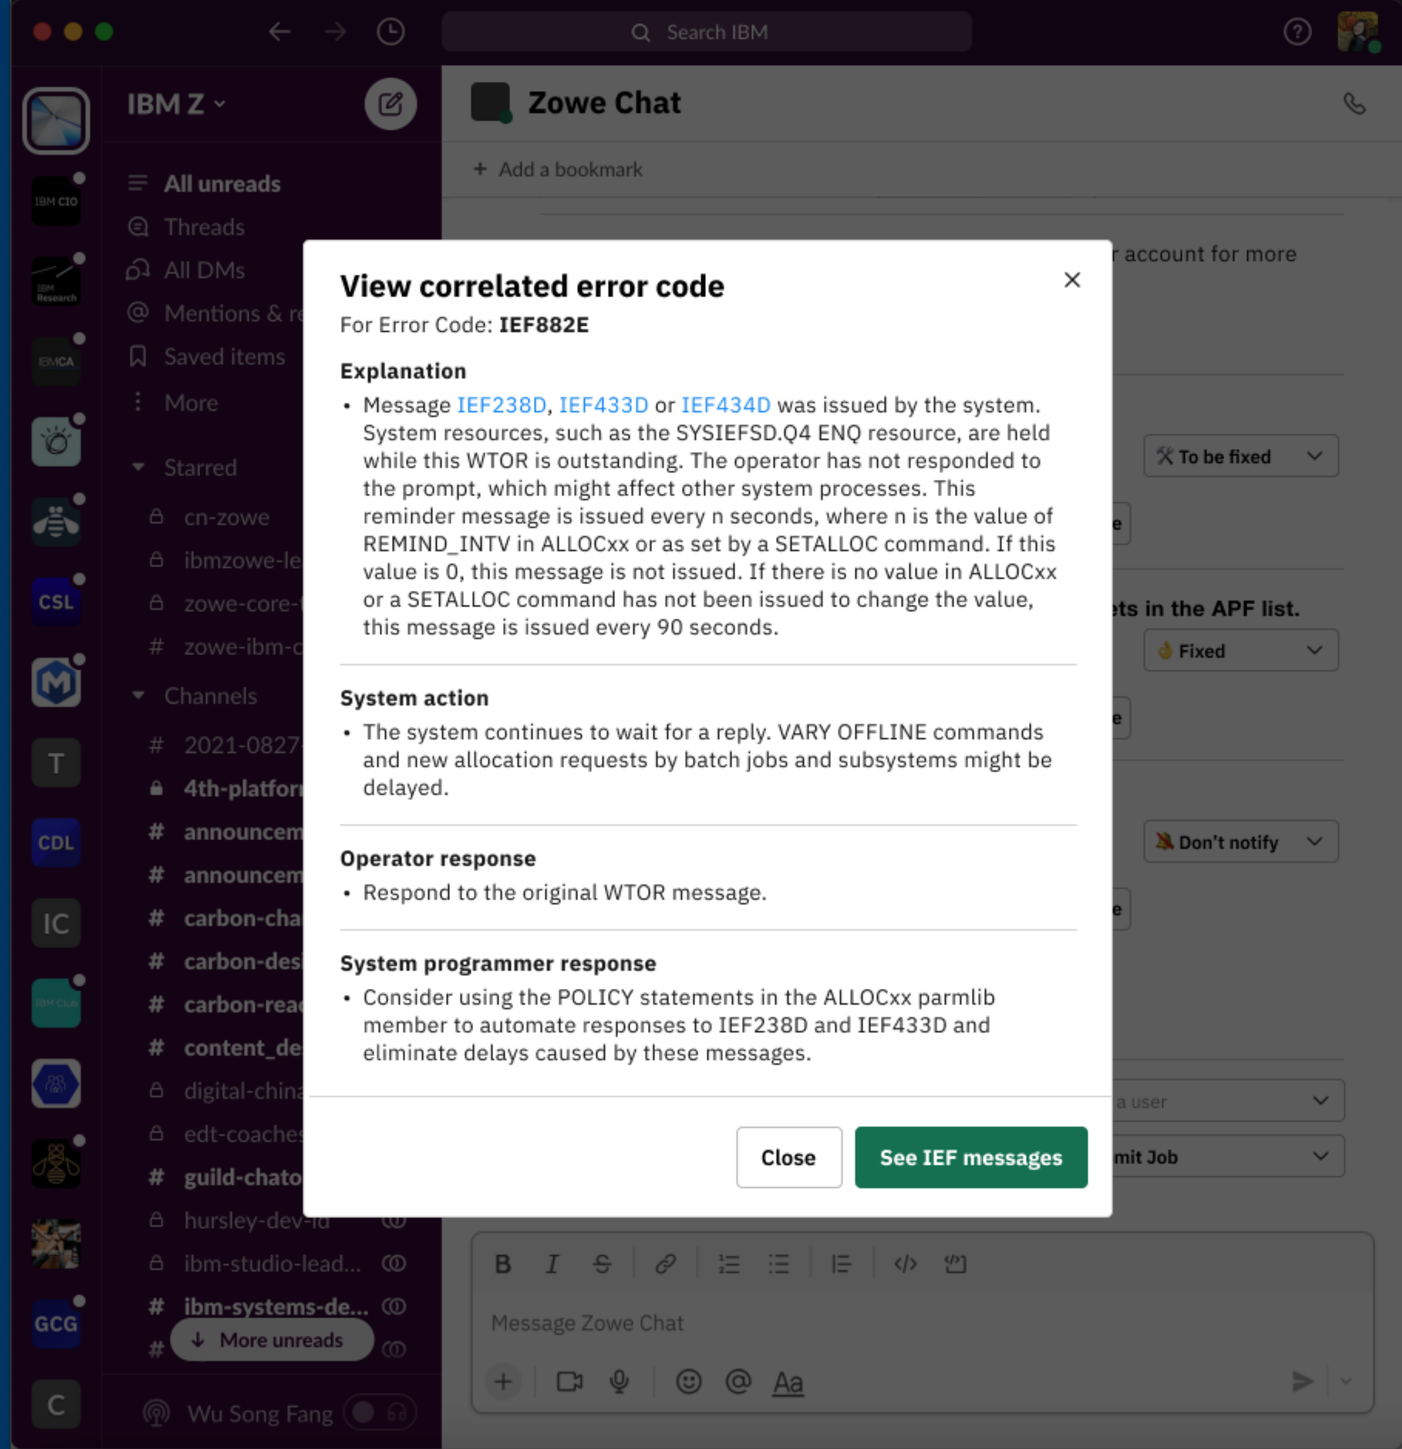
- Error code & msg: Error code could lead to the doc site
- View details to see Error code info



Design Mockup

View Error Code details

- Info from doc site
- Can directly link to doc



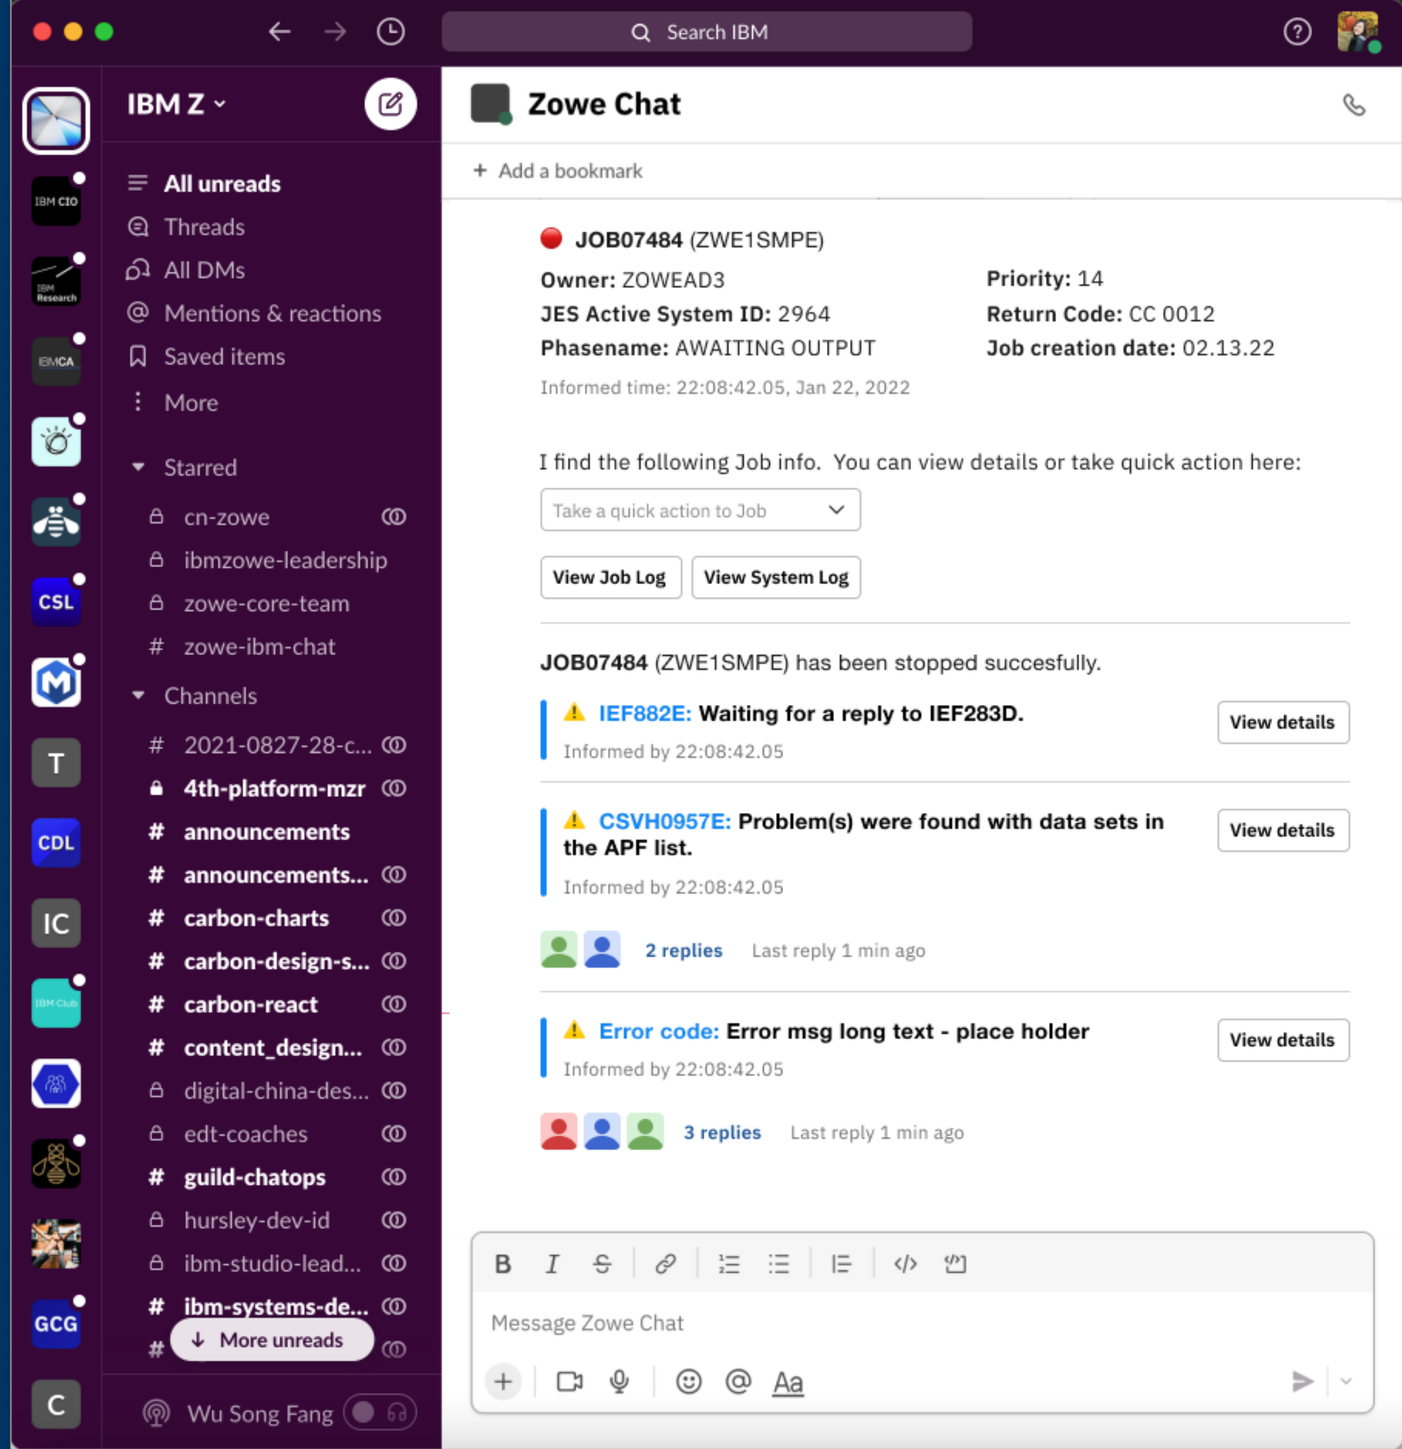
To be discussed:

- Can other correlated code in the doc also be linked.

Design Mockup

Threads

- Allow users to add Threads for different msg



Ideas for future version

- **Automatically** notification
- **Assign** to specific user, so this user can check the issues that he/she is responsible to
- Connect with Ticket System, so users can **check the status** of the issues: To-be-fixed, Fixed, Do not notify. It can help user filter the Jobs that need to be fixed only.
- View **Jobs with same error code**, so user can prioritize which Job to be fixed first.
- Share with customers about **historical** issue fixing, **common** situation they met

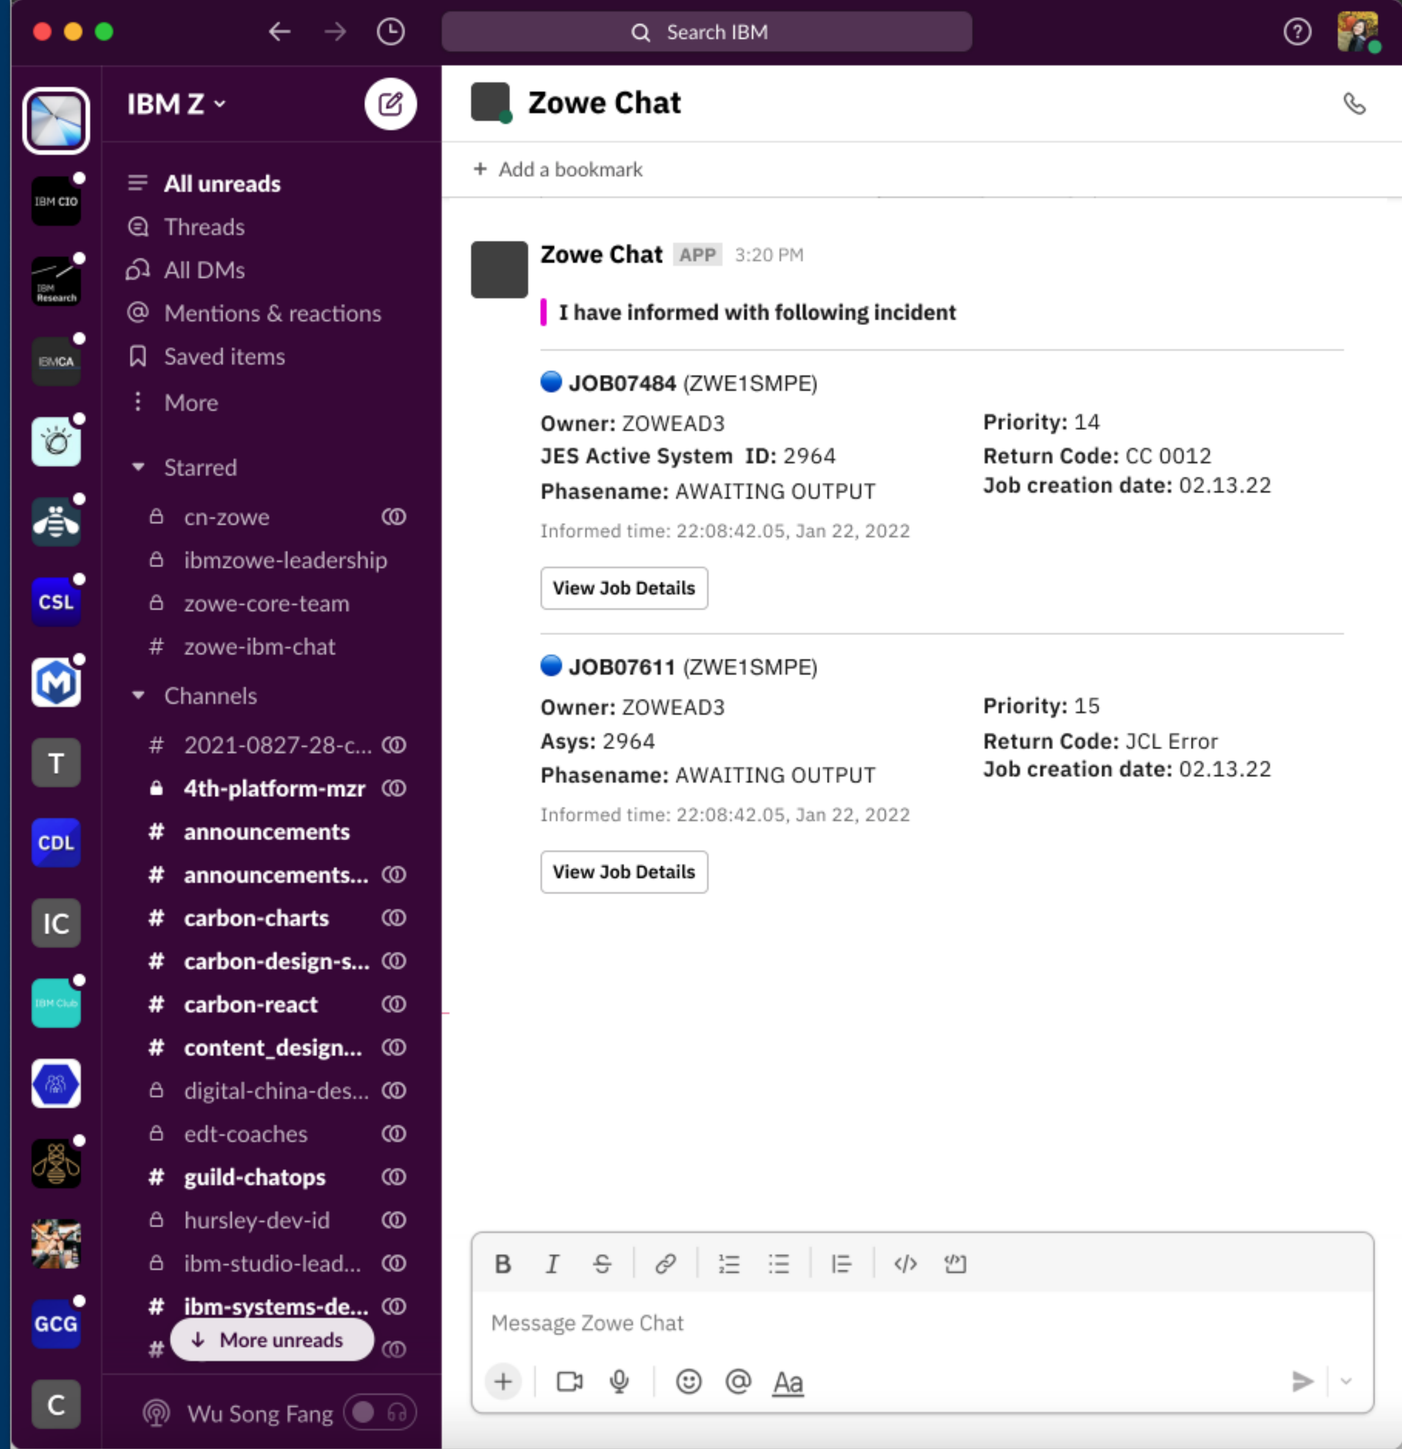
Design Mockup

Auto notification

- Show notification about the abnormal jobs

To be discussed:

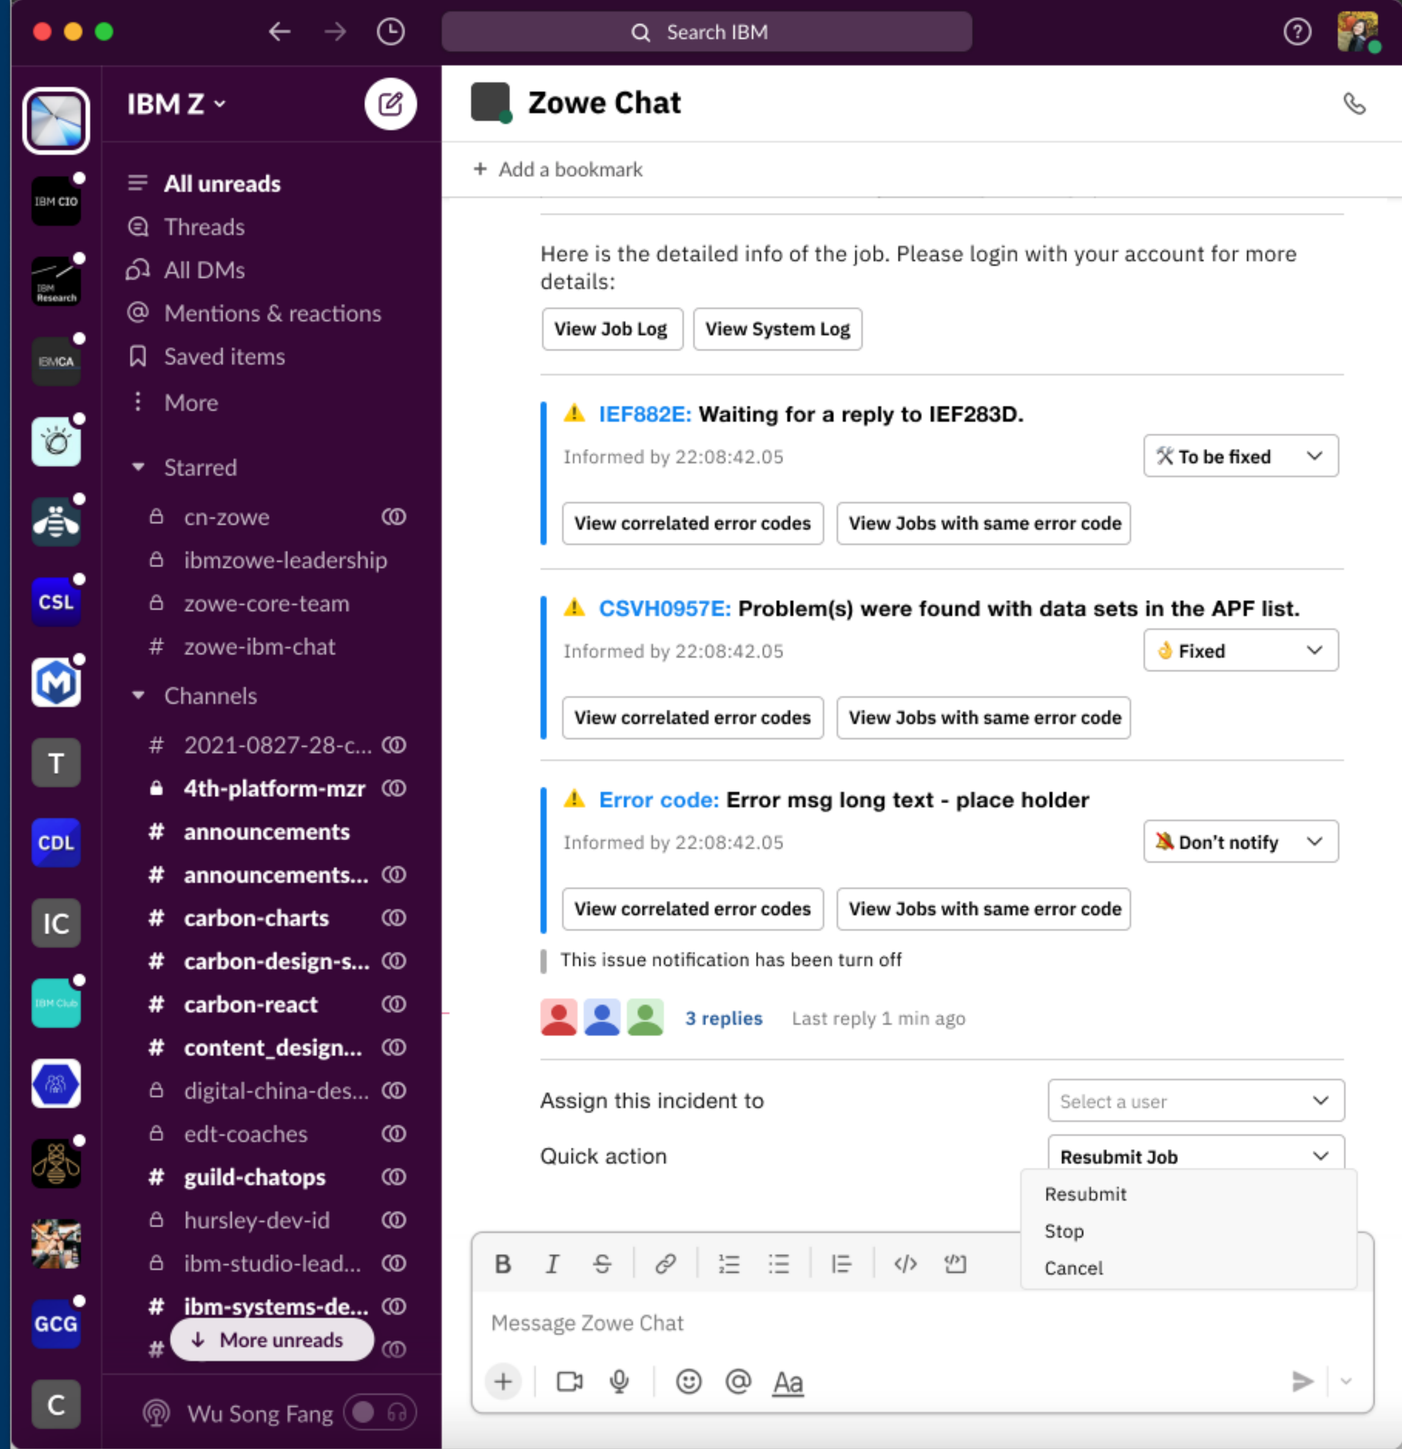
- When to send the notification?
- Can user configure in what situation, notification will be sent?
- How to display new msg when user is viewing one?



Design Mockup

Track issue fixing status

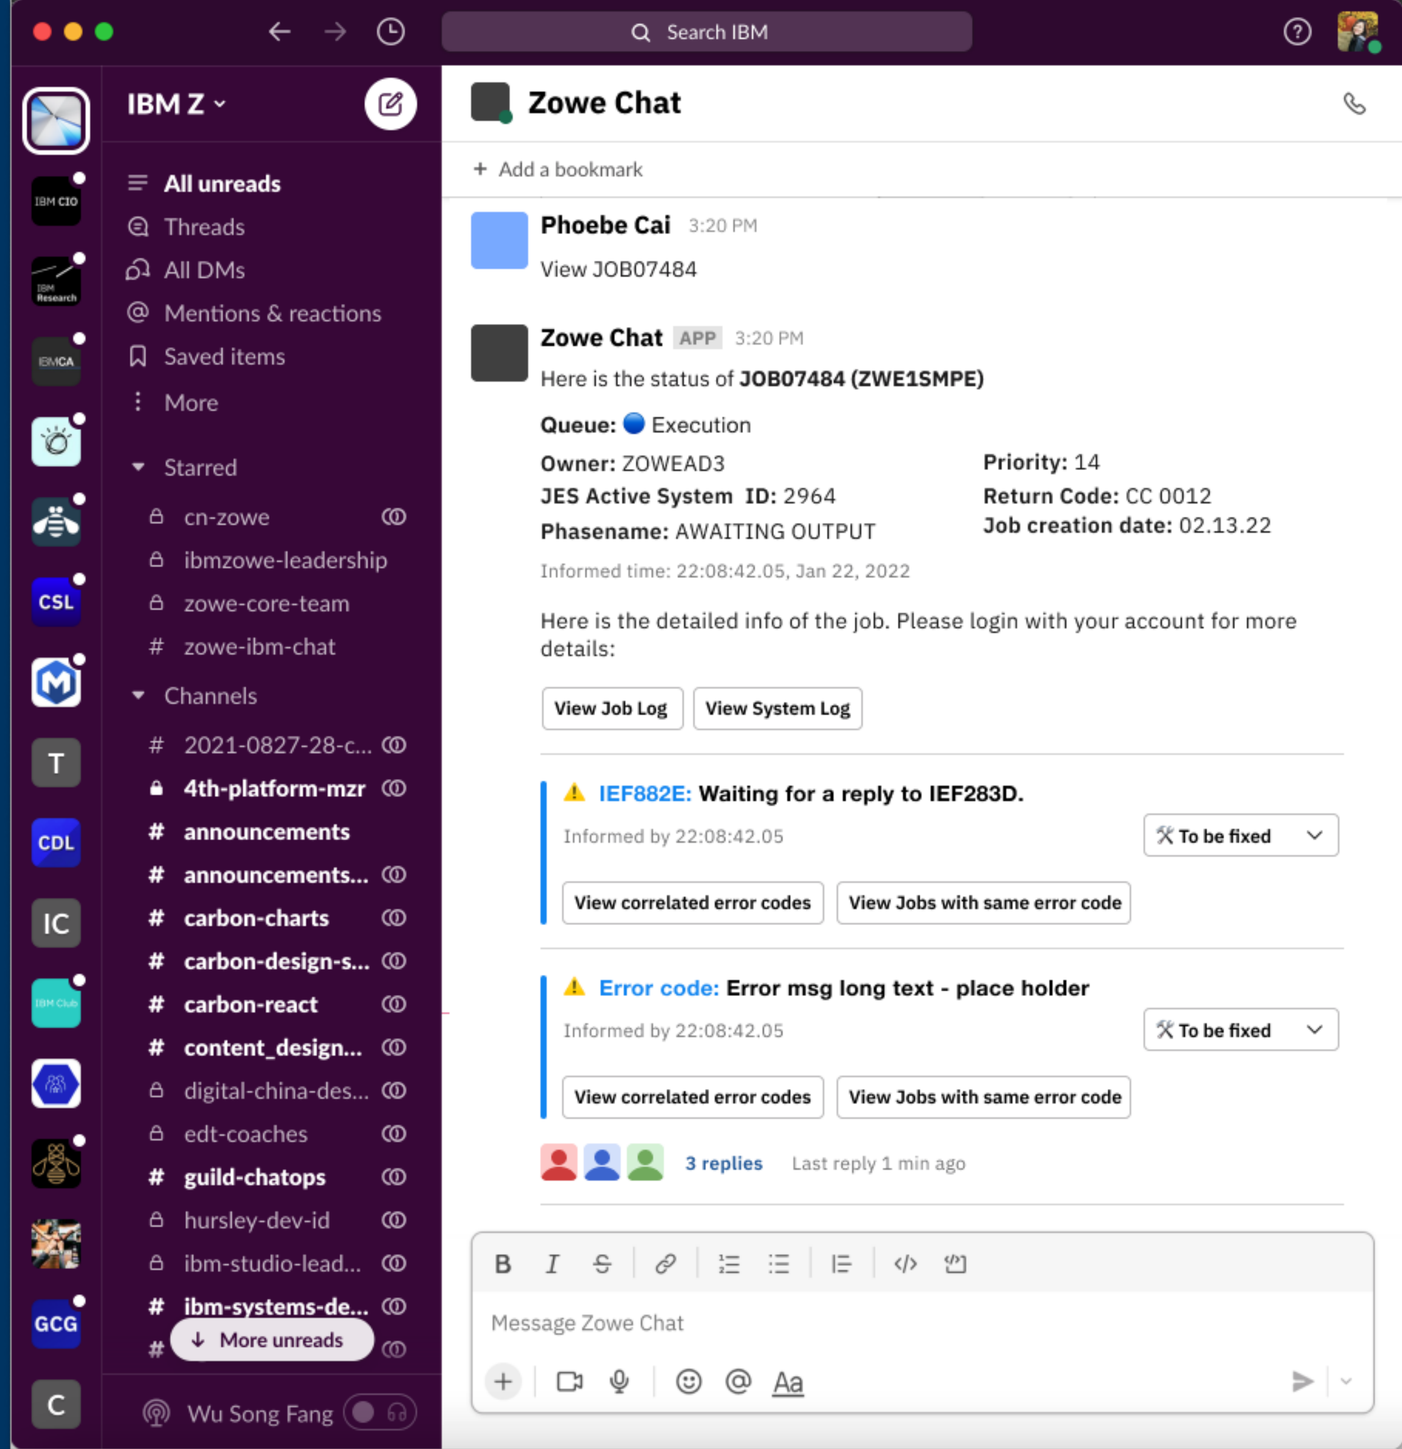
- To be fixed, Fixed, Do not notify. Status could help users request info that needs actions.
- Assign to specific user



Design Mockup

Issue status got changed

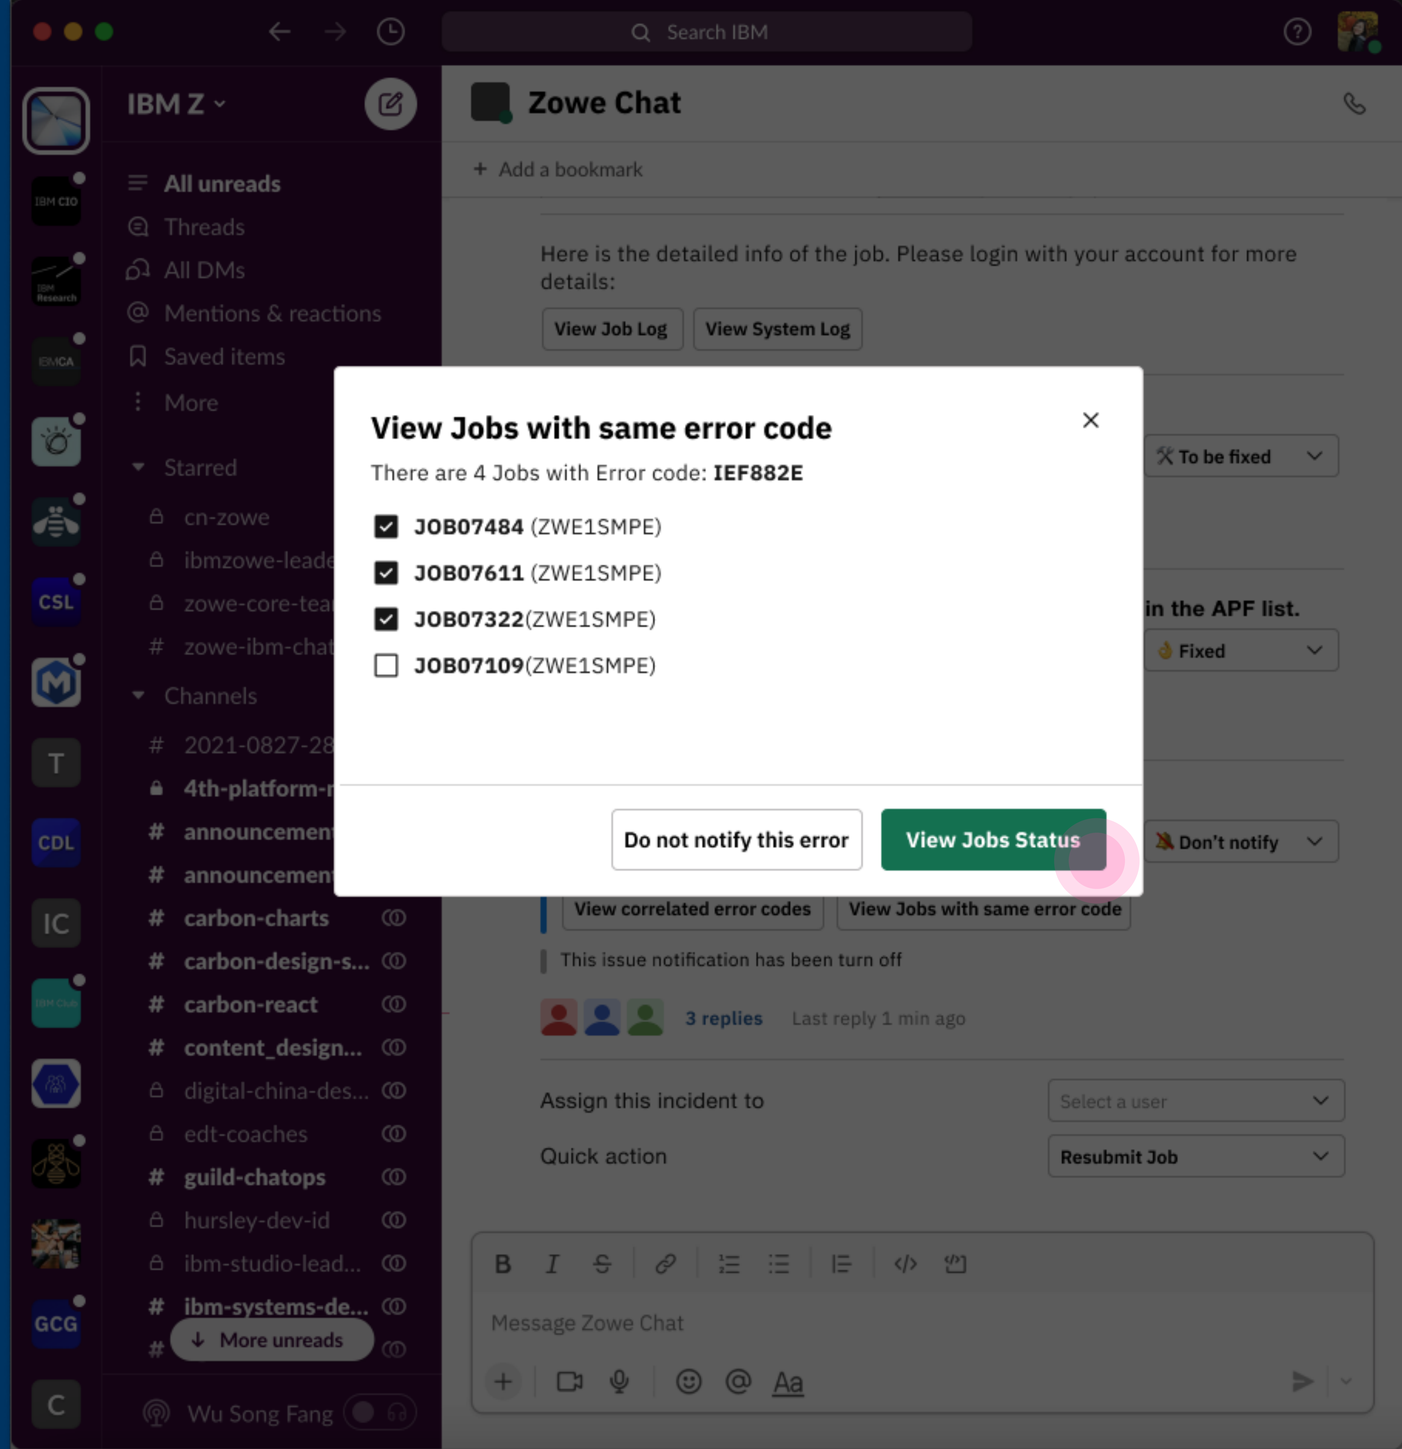
- When user request data of Job again, only shows error that need to be fixed
- Remove error that has fixed and set as do not notify



Design Mockup

View Jobs with same error code

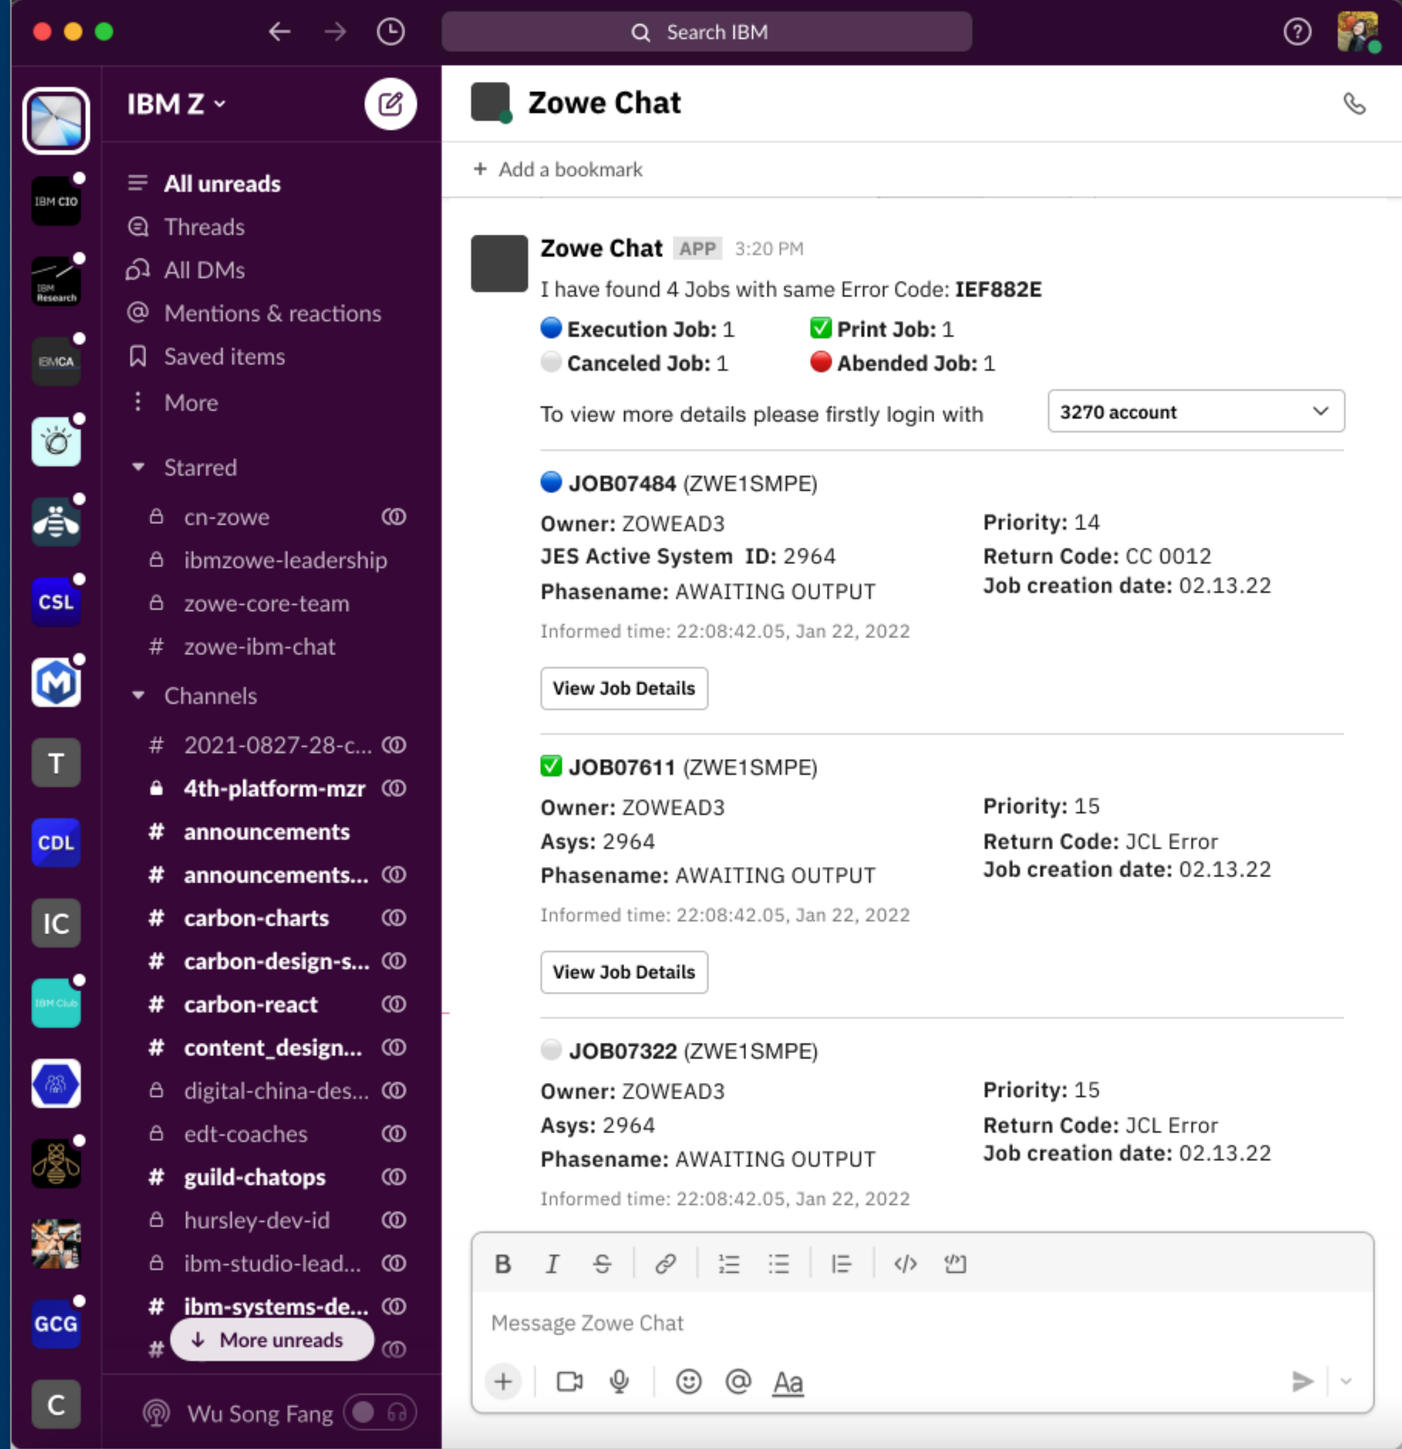
- It could be used as the reference for helping Operator define which Error could be in higher priority
- Pick the Jobs and request status info



Design Mockup

View Jobs with same Error Code

- These Jobs could be in different status



Asking for feedback

We are using surveys to help us validate our design and assumption in advance. We didn't only ask questions of ChatOps. We are trying to understand how users' current working flow, scenarios, pain points and then see how Zowe Chat could fit in. This survey may take **around 3 minutes** to complete it. So if you got any user contacts, feel free to send it to them.

There are two versions of the survey based on your job roles. We really appreciate your time and comments are completely anonymous.

- For mainframer: https://www.surveymonkey.com/r/VGGPMM8
- For non-mainframer: https://www.surveymonkey.com/r/LJRXYR6

Other Scenarios

- Job management (ongoing)
- Dataset management
- Query knowledge base error code
- Issue z/OS command
- Support NLP
- ....

- **Roadmap**
- **Hills**
  - Hill 0: Foundation items
  - Hill 1: Manage z/OS jobs from chat tools
  - Hill 2: Manage z/OS datasets from chat tools
  - Hill 3: Query knowledge base error code for z/OS
  - Hill 4: Issue z/OS commands from chat tools
  - Hill 5: Extend Zowe Chat
  - Hill 6: Support NLP
- **Architecture**
